AMENDMENTS TO THE CLAIMS

By the amendments set forth below, Applicant has cancelled Claim 7 without prejudice or disclaimer and has amended Claims 1 and 5. New Claims 8 and 9 have been added, and Claims 2–4 and 6 remain as originally filed.

1. (Currently Amended) A lighting circuit to operate a discharge lamp with a bi-pin base, the lighting circuit comprising a bypass circuit coupled across pins provided to a filament in the discharge lamp, wherein the bypass circuit comprises passive electronic devices that are [[is]] relatively inactive when the filament is in working condition and that become ~~becomes~~ active to allow continued starting and lighting of the discharge lamp when the filament is broken.

2. (Original) The lighting circuit of Claim 1, wherein the bypass circuit is a pair of diodes coupled in parallel and opposite directions.

3. (Original) The lighting circuit of Claim 1, further comprising a dimming circuit configured to vary the amplitude of an input voltage in response to a control signal to adjust the brightness of the discharge lamp.

4. (Original) The lighting circuit of Claim 1, further comprising:

a rectifier circuit configured to convert a substantially alternating current input voltage at a first frequency to a rectified voltage; and

an oscillator circuit configured to receive the rectified voltage and to produce a substantially alternating current output voltage at a second frequency to drive the discharge lamp, wherein the second frequency is relatively higher than the first frequency.

5. (Currently Amended) A method for extending the life of a discharge lamp, the method comprising coupling a redundant circuit comprising passive components across terminals provided to a cathode in the discharge lamp, wherein the redundant circuit is normally dormant but provides a conductive path between the terminals after the cathode wears out.

6. (Original) The method of Claim 5, wherein the redundant circuit is a diode.

7. (Cancelled)

8. (New) The method of Claim 5, wherein the redundant circuit is a pair of diodes coupled in an anti-parallel configuration.

9. (New) A lighting circuit to operate a discharge lamp with a bi-pin base, the lighting circuit comprising a bypass circuit coupled across pins provided to a filament in the discharge lamp, wherein the bypass circuit is a pair of diodes coupled in parallel and opposite directions, and wherein the bypass circuit is relatively inactive when the filament is in working condition and becomes active to allow continued starting and lighting of the discharge lamp when the filament is broken.
